DEVELOPMENTAL STAGE: Expression is restricted to the hematopole compartment. of development.

Prin: Heavily N- and O-glycosylated.
SINILARITY: Belongs to the protein-tyrosine phosphatase family.

Receptor class 1/6 subfamily.

PTM: Heavily N- and O-glycosylated.
SIMILARITY: Belongs to the protein-tyrosine phosphatase Receptor class 1/6 subfamily.
SIMILARITY: Contains 2 fibronectin type III domains.
SIMILARITY: Contains 2 protein-tyrosine phosphatase doma DATABASE: NAME=PROW; NOTE=CD guide CD45 entry;

J. Virol. 67:1203-1210(1993).
-I- FUNCTION: Structural protein that forms the virion spike and which is responsible for binding to target cells and subsequent fusion of the viral and host-cell membranes.
Structural glycoprotein precursor (Virion spike glycoprotein). Name=GP; Marburg virus (strain Popp).
                                                                                                                                                                                                                                                                 CARBOHYD

SUBUNIT: Homotrimer.

SUBCELLULAR LOCATION: Type I membrane protein.

PTM: O-glycosylated (Probable).

SIMILARITY: Belongs to the filoviruses glycoprotein family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    S33316; S33316

PTM: Heavily N- and O-glycosylated.
SIMILARITY: Belongs to the protein-tyrosine phospha
Receptor class 1/6 subfamily.
SIMILARITY: Contains 2 fibronectin type III domains
SIMILARITY: Contains 2 protein-tyrosine phosphatase

```
genome polyprotein - dengue virus type 2 (strain Jamaica)
N;Contains: capsid protein C; envelope protein E; membrane-associated protei
tural protein NS4a; nonstructural protein NS4b; nonstructural protein NS5
C;Species: dengue virus type 2
C;Date: 30-Sep-1989 #sequence revision 30-Sep-1989 #text_change 09-Jul-2004
C;Accession: A94346; A94378; A25613; A29199
R;Deubel, V.; Kinney, R.M.; Trent, D.W.
Virology 155, 365-377, 1986
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              F;1158-1174/Domain: transmembrane #status predicted <TM65
